antisense oligonucleotides which do not s during metabolism, useful e.g. for treating

invention describes low adenosine (A) content antisense

The present invention describes low adenosine (A) content antisense oilgonucleotides the A is replace (I) comprising them. In the antisense oilgonucleotides the A is replace (I) comprising them. In the antisense oilgonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgasic, manunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oilgonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with a critivating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and activity and antibodies, antibody receptors, cytokine and chemokine, endogenously produced specific and non-specific enzymes, binding proteins, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system creeptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system creeptors, binding proteins and malignancy associated proteins. The antisense oilgonucleotides may be used in this way to treat disorders and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vascociated with a disease or condition selected from pulmonary vascociated with a disease or condition selected from pulmonary vascociated with a disease or condition selected from pulmonary vascociated with a disease or condition selected from pulmonary vascociated with a disease or condition selected from pulmonary vascociated with a disease or condition selected from pulmonary vascociated with a disease or hypertension, emphysema, choole obstruction, pulmonary distress syndrome (C sud/or cancer AAF18434 to AAF21543 represent human polynucleotide from the present invention. trigger adenosine receptors during meta cancers and respiratory obstructions -Disclosure; Page 1344; 1592pp; English. The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which cargies nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasise to the lungs, including carcinomas, and cancers which may metastasise to the lungs, including carcinomas, and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the crelease of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AMA33311 to AAA33312 represent the maniformation of the adenosine content of the content nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences of iffer from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to AAA33992) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence listing.

The invention relates to entisense compounds that are targeted to a 5' or 3' untranslated region (5'UTR or 3'UTR) of a nucleic acid molecule encoding human interleukin-15 (IL-15), and inhibit the expression of human IL-15. The antisense

ö
inhibitors are is useful for inhibiting expression of IL-15 in human cells or tissues in vitro, for treating humans or other animals suspected of having or being prone to a disease associated with IL-15 expression, e.g. infections, inflammation or tumours. The inhibitors can also be used for research or diagnostic purposes. Using antisense compounds specifically and effectively inhibits IL-15 function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; bronchoconstriction; lung inflammatory; surfactant depletion; respiratory; bronchodilator; antinflammatory; immunosuppressive; antiasthmatic; analgasic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with activating peptide factors and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, chemokines, endogenously produced specific and non-specific enzymes, controlly proteins, adhesion molecules and their receptors, cytokines and binding proteins, adenosine receptors, bradykinin receptors, central cransmitters, defensine, adenosine receptors, bradykinin receptors, central receptors, consumptions and peripheral nervous and non-nervous system consumptions and peripheral nervous and non-nervous system ceeptors, binding proteins and malignancy associated proteins. The and/or bronchoconstriction and/or lung inflammation, allergyles) condition selected from pulmonary vasoconstriction, inflammation, allergyles, asthma, impeded respiration, respiratory distress syndrome condition selected from pulmonary vasoconstriction, inflammation, allergyles, pulmonary transplantation rejection, pulmonary disease or allergles, asthma, impeded respiration, respiratory distress syndrome condition selected from pulmonary vasoconstriction, inflammation, allergies, pulmonary transplantation rejection, pulmonary disease (CPDD), pulmonary transplantation rejection, pulmonary infections, bronchitis, candor maphysema, chronic obstructive pulmonary disease (CPDD), pulmonary invantion consert invantion coligonucleotides and in the exemplification of tragments and antisense oligonucleotides and in the exemplification of the present invanti

New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstriction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or

Disclosure; Page 1260~1264; 1343pp; English.

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which cargets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, cuseful for the treatment of disease associated with inflammation. The compositions are impaired airways, including lung disease and diseases whose secondary of instance or disease including lung disease and diseases whose secondary comparisor including lung disease and diseases whose secondary comparisor or attitions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic asthma, impeded respiration, respiratory distress syndrome, pain, cystic ibrosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the crelease of deoxyadenosine which activates adenosine ceceptors causing bronchoconstriction and inflammation. AAA33313 to AAA35312 represent the invention, which correspond to SED ID NO:11 to 1885, but the sequences of differ from the previously named sequences. SEQ ID NO:11 to 1885.

(AAA32331 to AAA33321 to AAA33321 to AAA33321 to 1885 sequences are also called SEQ ID NO:11 to 1885.

(AAA32331 to AAA33321 to AAA33321 are present invention. N.B. Sequences given in the disclosure of the present convention do not match up with their corresponding SEQ ID NO: sequences of invention and prosted invention to the disclosure of the present convention in the sequence listing.

The present sequence is human interleukin-15 (IL-15) gene allele located on chromosome 4q31. The polymorphic variants of IL-15 genes are useful cor studying the expression and function of IL-15 genes are useful cor screening for candidate drugs to treat diseases related to IL-15 polymorphic sites are useful for studying or individual at the novel IL-15 polymorphic sites are useful for studying corpulation diversity, anthropological lineage, the significance of diversity and lineage of the phenotypic level, paternity testing, forensic applications and for identifying associations between IL-15 corpulation and a trait such as level of drug response or susceptibility to disease. Identifying an association between a genotype or haplotype and a trait, is useful for developing diagnostic tests and therapeutic treatments for infections, human immunodeficiency virus and trait contains and present of a susceptibility or infections, human immunodeficiency virus and therapeutic treatments for infections, human immunodeficiency virus and therapeutic treatments for infections, human immunodeficiency virus and therapeutic treatment at a lover level and thus may be the basis for designing a diagnostic method to determine those individuals who will or will not respond to the treatment, or alternatively, will respond at a lower level and thus may require more those and naplotype or haplotype or haplotype or contained at a lower level and thus may require more those also useful for developing drugs targetting IL-15. The methods are also useful for developing drugs targetting IL-15. The contribution of movel IL-15 stogene and disorders affected by expression of function of novel IL-15 isogene and expression of an IL-15 isogene may be thready. So the isogene and expression of ultranslatable of in expression expression of ultranslatable of it is expression expression of ultranslatable of it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel polynucleotides comprising one of 11, PSI-PS11, single nucleotide polymorphisms in human interleukin-15 gene, and useful for treating disorders affected by expression of function of interleukin-15 isogene

The present sequence is human interleukin-15 (IL-15) gene located on chromosome 4931. The polymorphic variants of IL-15 genes are useful conchromosome 4931. The polymorphic variants of IL-15 genes are useful conchromosome 4931. The polymorphic of IL-15 and expressing concompleted to IL-15 packening for candidate drugs to IL-15 protein for useful for screening for candidate drugs to individual at the novel IL-15 polymorphic sites are useful for studying concompletion diversity, anthropological lineage, the significance of diversity and lineage of the phenotypic level, paternity testing, for ensists and integer of identifying associations between IL-15 genetic variation and a trait such as level of drug response or susceptibility to disease. Identifying an association between a genotype or haplotype and a trait, is useful for developing diagnostic tests and therapeutic treatments for infections, human immunodeficiency virus and therapeutic treatments for infections, human immunodeficiency virus and corresponse and a genotype or haplotype of an association between a clinical response and a genotype or haplotype (or haplotype pair) for the IL-15 gene may be the basis for designing a diagnostic method to determine those individuals who will or will not respond to the treatment, or alternatively, will respond at a lower level and thus may require more recomment that the substance of the present of the pair or the present of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The genotyping or haplotyping methods are also useful for developing drugs targetting IL-15. The genotyping and haplotyping methods are also useful for developing drugs targetting IL-15. The trials. IL-15 DNA is useful for therapeutic purposes for treating disorders affected by expression of function of novel IL-15 isogene and also in gene therapy. Expression of an IL-15 isogene and by transforming a targetted organ, tissue or cell population of an expression vector that expresses high levels of untranslatable mRNA for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CCCAGTTGCAAAGTAACAGCAATGAAGTGCTTTCTCTTTGGAGTTACAAGTTATTTCACTT 300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      As a similar species of IL-15 (sIL-15) was purified and analysed by SDS-
DAGE. Bioassay of unstained gel slices indicated IL-15 activity was
assoc. with proteins having mol. wts in the range of 15-17 kba. The
assoc. with proteins having mol. wts in the range of 15-17 kba. The
Cassoc. with proteins having mol. wts in the range of 15-17 kba. The
Cassoc. with proteins having mol. wts in the results indicated the
Identity of the first 33 AAs of AAR83309. Subsequent sequencing of a
Conn a cloud of AAR83305 was used to design synthetic of the
Car the amplification of IL-15-specific DNA sequences. The first
GAAs of the N-terminus were used to design one primer, a
degenerate mixture coding for all possible codon usages - AAT00528.
The AA sequences of the simian mature N-terminus 26-31 were used
to design a second primer, a degenerate mixture coding for a
complement of all possible codon usages of AAS 26-31, omitting
posn. 3 of Val (AAT00529, AAT00530). Polyadenylated RNAs from CV-1/EBNA
cells were used as templates. A 92 bp DNA fragment was used as a
hybridism. probe to screen a portion of a plasmid library contg.
Chy inserts prepd from CV-1/EBNA polyadenylated RNA. This
cented in the isolation of clone C85.sIL-15 that has an ORF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;;

New epithelium derived T cell factor - induces proliferation of T and B cells, stimulates destruction of tumour and virus-infected cells and protects against toxicity, partic. for treating intestinal disease and HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human ETF (epithelium derived T cell factor) cDNA was isolated by screening a IMTLH cell cDNA library with a simian ETF probe. The IMTLH cell line was derived from a stable transformation of a human bone marrow stromal cell culture with pSV3Neo. Mature hETF induces proliferation and/or differentiation of precursor or mature T cells and is useful for promoting long-term in vitro culture of T-lymphocytes and T-cell lines. It is used for treating gastrointestinal diseases including peptic ulcer, colltis and

AAT42242 standard; DNA; 489

AAT42242

```
This is the nucleotide sequence encoding a simian epithelium-derived
T-cell factor (ETF). The protein was purified from African green monkey
CV-1 kidney cells in culture by conventional chromatography: hydrophobic,
anion exchange and reverse phase HPLC, followed by separation by
SDS-PAGE. The proteins from the SDS-PAGE were transferred to a PUDF
nembrane and the band corresp. to ETF was cut out for peptide sequencing.
Primers were synthesised based on this sequence and used to amplify a
Primers were synthesised based on this sequence and used to amplify a
proliferate by phorbol 12-myristate 13-acctate. The 92 bp fragment was
proliferate by phorbol 12-myristate 13-acctate. The 92 bp fragment was
this sequence. ETF is a protein of 15-17 kD which is expressed by
cplithelial cells and stimulates proliferation and/or differentiation of
precursor and/or mature T cells. The protein is therefore useful for
promoting long term in vivo culture of T-lymphocytes and T-cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated simian and human epithelium-derived T-cell factors which stimulate the proliferation and/or differentiation of T-lymphocytes and T-cell lines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 489 BP; 162 A; 81 C; 92 G; 154 T; 0 other;

Muteins of simian IL-15 or human IL-15 (see also AAR98527) are useful as antagonists of IL-15 and can be prepd. by PCR-mediated mutagenesis of the encoding sequences. Preferred muteins have amino acid substitutions at Arspsfs and/or cln156 of the IL-15 protein that prevent signal transduction. They are useful for treating graft-versus-host disease and for prolonging allograft survival.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;;

```
This sequence encodes a human epithelium-derived T-cell factor (ETF) which is used in a method for treating or preventing gastrointestinal disease. These polypeptides have particular applitation in the treatment of gastrointestinal disorders associated with disruption of the gastrointestinal epithelium or villi such as chemotherapy- and radiation-therapy induced entertits (gut toxicity) mucositis, peptic ulcer disease, gastroenteritis and collitis, villus arrophic disorders, malignancy and inflammatory bowel disease. ETF polypeptides may also be useful in the treatment of human immunodeficiency virus (HIV) and HIV associated disease due to their abillity to stimulate CDA+ and cDB+ cells. Biologically active ETF may be used to treat a variety of other diseases or conditions where T-cell or B cell stimulation is desired.
Treatment or prevention of gastrointestinal diseases - by administering epithelium-derived T-cell factor polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 489 BP; 162 A; 81 C; 92 G; 154 T; 0 other;

The invention relates to an isolated antibody that binds specifically to a simian or human epithelium-derived T-cell factor (ETF) polypeptide. The antibodies are used, optionally when immobilized or labeled, to detect and quantify ETF in standard immunoassays. They may also be used as diagnostic and therapeutic agents, e.g. when conjugated to toxins (or their precursors) or radionaclides. ETF induces proliferation and/or differentiation of T cells (or their precursors), e.g. of tor use in establishing long term in vitro cultures; and is also used to treat gastrointestinal disease (e.g. enteritis or mucositis induced by chemotherapy or radiation, peptide ulcer, gastroenteritis, colitis, chemotherapy or radiation, peptide ulcer, gastroenteritis, colitis, chuman immune deficiency virus infection or associated disease, or generally in any situation requiring stimulation of T or B cell corressed anti-infectious disease immunity, induction of T-cell lytic

activity or increased destruction of tumour or virus-infected cells. The present sequence represents a DNA encoding a human ETF precursor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents the simian interleukin 15 (IL-15) nucleotide sequence. The IL-15 nucleotide sequence and the protein encoded by it can be used to determine and create antagonists of IL-15. An antagonist of IL-15 can be used for treating an inflammatory bowel disease (IBD). The invention relates to the treatment of celiac disease using IL-15 antibodies antagonists. The antagonists are preferably muteins of IL-15, antibodies against IL-15 or IL-15 molecules bound to chemical groups that interfere with the ability of IL-15 to effect a signal transduction through either the alpha or the gamma subunit of the IL-15 receptor complex. The IL-15 antagonists of the invention can be used to treat irritable bow disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of antagonists of interleukin-15 for treating an inflammatory bowel disease, particularly celiac disease

stimulates precursor or mature CD4+ and CD8+ T-lymphocytes to proliferate and differentiate. It also promotes proliferation of the gastrointestinal epithelium. The protein can be used to promote long-term in vitro culture of T-lymphocytes and T-cell lines. ETF can be used for treating HIV infection, HIV-associated diseases, and other diseases or conditions where stimulation of T-cell proliferation would be desirable e.g., it could be used to augment the destruction of tumour cells or virally. Infected cells. ETF may also be used to treat or prevent gastrointestinal disease, including chemotherapy and radiotherapy associated enteritis, disease, including chemotherapy and radiotherapy associated enteritis, collitis, inflammatory bowel disease and villus atrophic disorders. Chemotherapy and radiotherapy associated enteritis (gut toxicity) results in bleeding and sepsis due to gastrointestinal flora checity results in bleeding and sepsis due to gastrointestinal flora administered to a cancer patient. ETF may therefore be used to increase the tolerated doses radiotherapy and chemotherapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to simian and human epithelium-derived T-cell factor (ETF) polypeptides. Antibodies that specifically bind to the ETF polypeptides are used for treating or preventing gastrointestinal diseases, such as chemotherapy and radiation therapy-induced enteritis and mucositis, peptic ulcer disease, villus atrophic disorders and inflammatory bowel disease; for increasing tolerated doses for radiation therapy and chemotherapy agents which are limited by gastrointestinal coxity; and for treating HIV and HIV-associated diseases. The coxitity and for treating HIV and HIV-associated diseases. The conditions where it is desired to stimulate proliferation of mumunoglobulin B lymphocytes and B lymphocytes, or the secretion of immunoglobulin B lymbocytes, to augment anti-infectious disease immunity, to induce CTL, LAK or NK lytic activity, or to augment the destruction of tumour cells or cells infected with virus. The present sequence represents a CDNA center of the content of content of the content of c

A simian species of IL-15 (sIL-15) was purified and analysed by SDS-
PAGE. Bioassay of unstained gel slices indicated IL-15 activity was
assoc. with proteins having mol. wts in the range of 15-17 kDa. The
assoc. with proteins having mol. wts in the range of 15-17 kDa. The
cassoc. with proteins having mol. wts in the range of 15-17 kDa. The
identity of the first 33 AAs of ARR83309. Subsequent sequencing of a
condition obtd. from a simian library provided a sequence encoding
the polypeptide AAR83436. AAR83309 subsequence encoding
con the polypeptide AAR83430 was used to design synthetic PCR primers
con the amplification of IL-15-specific DNA sequences. The first
of AAs of the N-terminus were used to design one primer, a
degenerate mixture coding for all possible codon usages - AAT00528.

The AA sequences of the simian mature N-terminus 26-31 were used
complement of all possible codon usages of AAs 26-31, omitting
complement of all possible codon usages of AAs 26-31, omitting
complement of all possible codon usages of AAs 26-31, omitting
complement of all possible codon usages of AAS 26-31, omitting
complement of all possible codon usages of AAS 26-31, omitting
complement of all possible codon usages of AAS 26-31, omitting
complement of all possible codon usages of AAS 26-31, omitting
complement of all possible codon usages of AAS 26-31, omitting
complement of all possible codon usages of AAS 26-31, omitting
complement of all possible codon usages of AAS 26-31, omitting
complement of all possible codon usages of AAS 26-31, omitting

The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is affilicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide useful as a marker for the diagnosis of breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human breast cancer expressed polynucleotide 11572.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 384 BP; 126 A; 63 C; 67 G; 127 T; 1 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to simian and human epithelium-derived T-cell factor (ETF) polypeptides. Antibodies that specifically bind to the ETF polypeptides are used for treating or preventing gastrointestinal diseases, such as chemotherapy and radiation therapy-induced enteritis and mucositis, peptic ulcer disease, villus atrophic disorders and therapy and chemotherapy agents which are limited by gastrointestinal toxicity; and for treating HIV and HIV-associated diseases. The antibodies are further used to treat a variety of other diseases or conditions where it is desired to stimulate proliferation of T-lymphocytes and B lymphocytes, or the secretion of immunoglobulin B imphocytes, to augment anti-infectious disease immunity, to induce CTL, IAW TR LYLIC activity, or to augment the present sequence represents a cDNA cenceding the human ETF (HETF) mature polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and polypeptides are also useful for isolating compounds with cytostatic activity.
                                                                                                                                                                                                                                                                                                                                         New peptide useful as a marker for the diagnosis of breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 29; DB 22; Length 474;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         nucleic acids, targeted to interleukin-15 (IL-15). The products of the invention have anti-IL15, anti-inflammatory, hepatotropic, anti-arthritic, neuroprotective, antipoliferative and antiulcer activity and can be used for gene therapy. The antisense oligonucleotides are used to inhibit interleukin-15 (IL-15) expression and production, and prevent the recruitment and activation of macrophages. They are used to treat diseases associated with an increased expression of IL-15. Such diseases include inflammatory disorders, such as inflammatory bowel disease,
                                                                   The invention relates to human breast cancer expressed polynucleotides (AALO7544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     to
as
   as a marker for the diagnosis of breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel antisense oligonucleotides of 8-40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antisense oligonucleotides targeted to interleukin-15 used treat inflammatory diseases and cell proliferative diseases such inflammatory bowel disease and chronic liver disease -
                                                                                                                                                                                                                                                                                                                                                                 ;

This invention describes novel antisense oligonucleotides of 8-40 nucleic acids, targeted to interleukin-15 (IL-15). The products of the nucleic acids, targeted to interleukin-15 (IL-15). The products of the invention have anti-Till5, anti-Inflammatory, hepatotrophic and an be used for gene therapy. The antiproliferative and antiulcer activity and can be used for gene therapy. The antisense oligonucleotides are used to inhibit interleukin-15 (IL-15) expression and production, and prevent the recruitment and activation of macrophages. They are used to treat diseases associated with an increased expression of IL-15. Such diseases include inflammatory disorders, such as inflammatory bowel disease. Include inflammatory disorders, such as inflammatory bowel disease, architis, cirrhosis, multiple sclerosis, chronic liver disease, ulcerative colitis and cell proliferative disorders. The treatment may be in vivo or ex vivo. The antisense oligonucleotides of the invention expensive to make expressed from DNA or RNA vectors. AAZ88709-288723 cepressent the antisense ligonucleotides disclosed in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             IL-15; interleukin 15; human; anti-IL15; anti-inflammatory; hepatotropic; anti-arthritic; neuroprotective; antiproliferative; antiulcer; antisense; gene therapy; macrophage; inflammatory disorder; bowel disease; primer; arthritis; cirrhosis; multiple sclerosis; chronic liver disease; ulcerative colitis; cell proliferative disorder; treatment; ss.
arthritis, cirrhosis, multiple sclerosis, chronic liver disease, ulcerative colitis and cell proliferative disorders. The treatment may be in vivo or ex vivo. The antisense oligonucleotides of the invention are specific for interleukin-15 (IL-15), and can be delivered exogenously or can be expressed from DNA or RNA vectors. AAZ88709-288723 represent the antisense ligonucleotides disclosed in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NOTE: This is a 'working draft' sequence. It currently consists of 13 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Center clone name: 393_K_13

Sequencing vector: M13; M77815; 100% of reads
Sequencing vector: M13; M77815; 100% of reads
Chemistry: Dye-terminator B1g Dye; 100% of reads
Assembly program: Phrap; version 0.960731
Consensus quality: 15576 bases at least Q30
Consensus quality: 162025 bases at least Q30
Consensus quality: 162041 bases at least Q30
